Agenda

Introduction (Topology, Scale) Managing the network (Ansible, Inspec Tests) Network services (Kubernetes, Anycast, EVPN) Network Operating Systems (Cumulus, SONIC) Summary

Introduction

Network Topology Overview

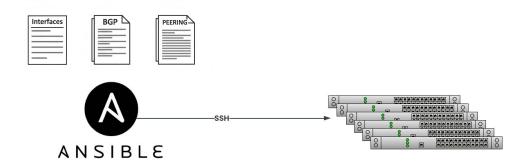

- CLOS topology
- 3 locations
- 150+ racks
- Almost 200 network devices
- BGP unnumbered

Managing the network

Network as code

- Configuration grouped by function not by device
 - Interfaces
 - o BGP
 - Peerings
 - Permissions
 - Prometheus exporters
 - DHCP relay
- Supported on Cumulus and SONiC

Automated tests - topology creation

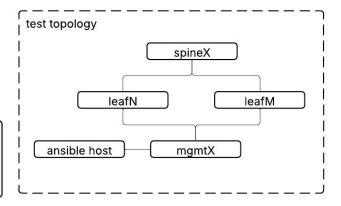

- Topology definition in graphviz DOT syntax
- Topology Converter converts
 DOT file to Vagrantfile
- Interconnections between VMs made using UDP unicast tunnels
- We use up to 30 VMs with up to 100 interconnections in some test environments

```
Topology Converter Vagrantfile Libvirt
```

```
//
// network links
//

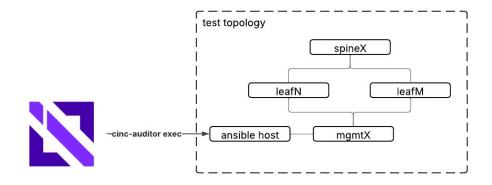

// leaf -> spine: ports swp1..58

"dc1-leaf01":"swp1" -- "dc1-spine01":"swp1"
"dc1-leaf01":"swp2" -- "dc1-spine02":"swp1"
"dc2-leaf01":"swp1" -- "dc2-spine01":"swp2"
"dc2-leaf01":"swp2" -- "dc2-spine02":"swp2"
"dc3-leaf01":"swp1" -- "dc3-spine01":"swp3"
"dc3-leaf01":"swp2" -- "dc3-spine02":"swp3"
```

Automated tests - cinc-auditor

- Cinc-auditor runs tests on ansible-host VM in test topology
- Tests utilise ssh, http, etc to get required state of the topology
- We use custom cinc-auditor resources for routing, connectivity, etc
- Some tests imitate failure of link or switch to test high availability

```
helpers.exits_dc1.each do |switch|
  describe net_bgp_route(switch, route: '172.17.4.26/26', vrf: 'external') do
    it { should_not exist }
  end

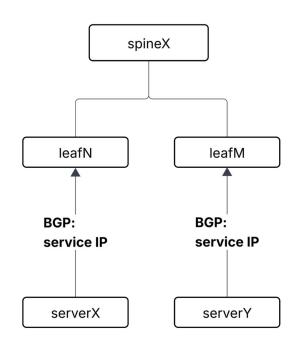

describe net_bgp_route(switch, route: '172.17.4.23/32', vrf: 'external') do
  it { should exist }
  its('next_hop_count') { should eq 3 }
  its('next_hops') { should include '172.17.1.3' }
  its('next_hops') { should include '172.17.2.3' }
  its('next_hops') { should include '172.17.3.3' }
  end

describe net_bgp_route(switch, route: '172.17.10.28/32', vrf: 'external') do
  it { should_not exist }
  end
end
```

Network services

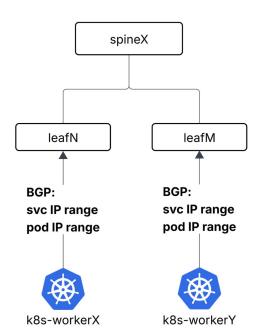

Network services - anycast for service HA

- Service HA is implemented by multiple servers advertising service IP via BGP
- In case one server goes down, it stops advertising service IP and traffic shifts to other servers
- We use this for NAT, front reverse proxies, PXE, etc.

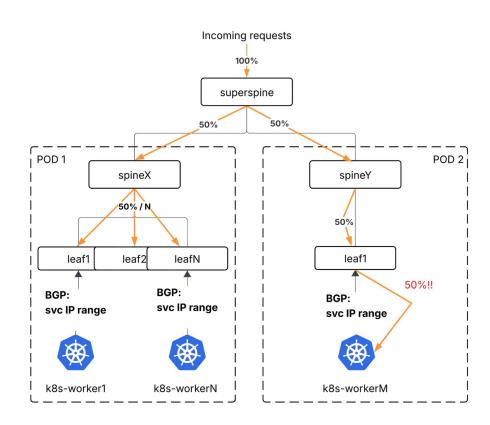

Network services - kubernetes (1)

- Kubernetes workers integrate into network over BGP with leaf switch in rack
- Advertises svc IP range (anycast) and pod IP range (unique per worker)

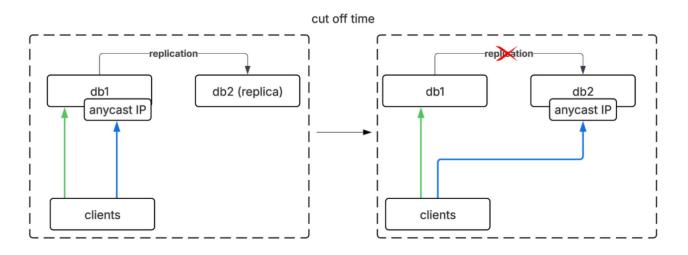

Network services - kubernetes (2)

- We had only few kubernetes worker nodes in POD 2.
- 50/50 traffic split consumed all available NIC traffic on workers in POD2
- It resolved when we started using Istio with envoy as fronts receiving incoming traffic - it uses pod IPs as upstreams instead of svc IP.

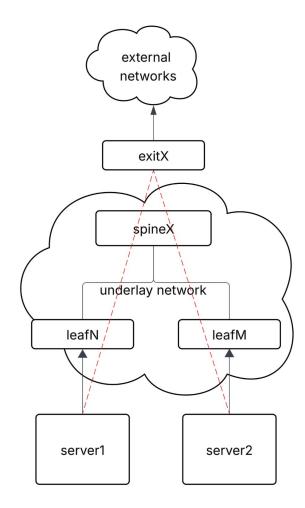

Network services - database sharding

- Anycast allowed us to have virtual IP for the database sharding in a L3 network
- In L2 network we would just move the IP to the other host and make sure ARP records got updated to the new MAC
- Currently, database sharding at Vinted is done by utilizing Vitess tools.

Network services - EVPN

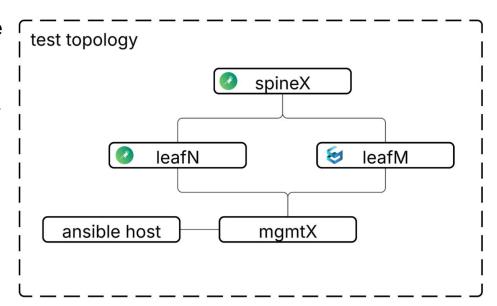

- EVPN for external network
- server1 and server2 connected to exitX as layer 2
- VTEPs are on leaf and exit
- External network in any rack/leaf
- Complex to troubleshoot
- Decommissioned at Vinted

Network Operating Systems

Network Operating Systems - Cumulus and SONiC

- Cumulus supported multiple hardware manufacturers until it got acquired by Nvidia
- We use SONiC instead of Cumulus for new hardware
- SONiC image community version built in house
- We use both in our testing env cumulus VX and sonic VS

Summary

Summary

- Network as code from the beginning
- Automated tests and easy to set up test environments
- As simple as possible no unnecessary functionality
- Still no dedicated network team at Vinted
